DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 1-20 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 1, in the phrase “a pathway positioned...first member;”, it is unclear in the context of the claim how the pathway is structurally related to other aspects of the device. Is it part of the first member?

In claim 4, with respect to radial motion and rotating motion, it is unclear what exactly is rotating in these ways, and relative to what aspect of the invention.

In claim 11, lines 8-9, the phrase “a first channel...interference position” is worded such that it appears there are two different channels, as oppose to two different positions within the same channel.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-5 and 7-12, as best understood, are rejected under 35 U.S.C. 102(b) as being anticipated by Habegger et al., US Patent 6,393,664. A hinge is provided including a first fixed member and a second member rotatably connected to the first member. A pathway or channel 10 is provided with a ball D retained therein. The ball moves against gravity due to rotation of member E, thereby meeting the claimed limitations. As shown in figure 3, the ball interferes with the relative motion of the hinged members. A cam surface (43, 44) follows a cam path during rotation. The surface of the cam forms an inclined region (push-out section and curve-out), performing a detent function. The spring C inherently acts as a damper. The claimed method is inherent to the design.

Allowable Subject Matter

5. Claims 6 and 13-20 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, 2nd paragraph, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims.
